

TEAMPNEUMAT
SILO CLEANOUT SERVICE

Call the Bin Cleaning experts.

the **best** tools

an unmatched
safety record

commitment to
continuous
improvement

a record of
good customer
relationships

PNEUMAT
SYSTEMS INC.

Maximize Safety – Minimize Down Time

QUICK RESPONSE

Pneumat has been building the equipment and performing bin and silo clean-out services since 1982. Call TeamPneumat for help and they're on their way, ready to provide expertise that gets production back on track, fast.

EFFECTIVE, HYDRAULIC-POWERED EQUIPMENT

The powerful Cardox Blasting System and the hydraulic-powered BinWhip and BinDrill put Pneumat Systems at the cutting edge of bulk solids flow management. TeamPneumat gets the job done the first time, with the best tools available.

PROFESSIONAL SERVICE

Why hammer or poke at the problem? When the real costs of a built-up, ratholed, bridged or plugged silo are calculated, it's easy to see that TeamPneumat is the smart choice for the fast, economical and safe reclamation of your storage vessel.

A SAFETY RECORD NO-ONE CAN MATCH

Pneumat Systems does not have an official government safety record because there has never been safety violation. Pneumat Systems makes bulk material maintenance less dangerous.

Pneumat minimizes problems, maximizes safety, and stands behind its products. All costs are clear so there's never any confusion about price. Pneumat employs only highly trained staff, that works in the open, and always follows through. Let Pneumat help you keep your production line in motion.

It's too expensive not to fix the problem.

Pneumat will go head-to-head with ANY competitor.

Service On Call - Make the call and forget about the problem.

Unique tools give us the edge.

- Quick response
- Highly trained personnel
- Safety first
- Proprietary, all-hydraulic tools
- Equipment designed, used & perfected by TeamPneumat
- Self-sufficient crews, well equipped
- Only 3-phase electrical needs to be supplied by customer
- Efficient service delivery
- Customer may participate as desired - No hidden operations
- On the job until it's finished
- No hidden costs

BINWHIP

Pneumat's BinWhip is powered by hydraulics, which means that there is more power and better control. Hydraulic cleaning heads deliver tremendous power, yet are safe, easy to control, and won't damage vessel walls. The BinWhip works from the top of the vessel, which eliminates the need for dangerous, confined space entry. No external air power is required.

BINDRILL

BinDrill is the safe, effective way to break through solidified material in a bulk materials production line. Precise, controlled, all-hydraulic power gives it the to work its way through rock-hard materials. And a practical plus—BinDrill and BinWhip use the same Hydraulic Power Unit, which requires only a 440 Volt 3-phase electrical hook-up to operate.

CARDOXCO2

Cardox is powerful enough to break concrete, coal and other rock-hard materials in less than a second. It works where other tools cannot, because it's powered by controlled release of carbon dioxide, a gas that can be used in high-temperature production areas and where hazardous, flammable, or combustible materials are stored.

AIRFORCE

Air Cannons are permanently installed, so are not used by TeamPneumat. But they are frequently requested by customers as a simple tool for ongoing flow maintenance. Regular blasts of plant air from Air Cannons prevent build-up that causes more serious problems.

RAILSPREADER

RailSpreader makes filling railcars full a much easier and safer job. By redirecting the grain flow from down to out the railcar fills from the outside hopper walls into the center inverting the angle of repose and filling in the voids normally found at the top. All this less dust and no shoveling or re-topping to try and make weight.

HOPPER POPPER

HopperPopper makes easy work of unloading hard cars and hopper trucks, without all the back breaking labor and or damage to hoppers. AirForce blasting technology is coupled with wireless remote controls to place a 360° nozzle into stubborn non-flowing materials such as DDGs or soya meal to knock loose material and re-fluidize it to make it flow out the gate without a single sledge hammer!
